

Lab 4 - Tables & Forms

Lab 4 - Tables & Forms

Overview

This lab will exercise your knowledge of the content in the [HTML Tables](#) and [Web Forms](#) chapters of MDN's [Learn web development](#) tutorial series, specifically the following sections:

- [HTML table basics](#)
- [HTML Table advanced features and accessibility](#)
- [Your first form](#)
- [How to structure a web form](#)
- [Basic native form controls](#)
- [The HTML5 input types](#)
- [Other form controls](#)
- [Sending form data](#)

 The above list does not include all the sections of the Web Forms chapter. You are NOT responsible at this point for any section not in the list above. Specifically, we will cover the styling of tables and forms later in the course.

 Before you attempt this lab, you are expected to have read through the above sections and completed the hands-on exercises and self-assessments throughout the readings to gain more hands-on experience.

 Unless otherwise stated, for each of the pieces below create a `div` within the respective `html` file giving it the id of header contents. It is within the `div` that the work will be completed. eg. The div created for: Making a table should look like:

```
<div id="making-a-table">
  <!-- Results from the provided instructions. -->
</div>
```

Making a table

1. Within `index.html` add a table element just before the "My Favourite Thing" heading.
2. Give the table a caption with the text "Table 1. Current Courses"
3. Use appropriate HTML to produce a table like the one below, it should contain a list of courses you are taking.

Table 1. Current Courses

Term	Course		
	Code	Name	Hrs/Week
Fall	CSD105	Python	3
	CMM115	Communications I	3
	CSD120	Introduction to Web Development	4
	CSO104	Introduction to Operating Systems and LAN	4
	MTH122	Computer Mathematics	3
	TNY130	Technology in Society	2
Winter	CSA103	Business Applications I	4
	CSD102	Programming Using C++	5
	CSD212	Web Scripting Languages	4
	CSO102	Introduction to Linux	4
	CST104	PC Hardware and Networking	5
Total			41

 Your table should NOT have lines. (Yes, it will be ugly for now. You will style this table in a later lab.) The lines included in this image are to help you understand the table layout. If you would like to see these lines in your own web page for debugging purposes, add the following to your `<head>` (but be sure to remove it before submitting!):

```
<style>
  table { border-collapse: collapse; }
  th,td { border: 1px solid rgba(0,0,0,0.2); }
</style>
```

In your table you must:

- Indicate table **header** cells using an appropriate element
- Use attributes to cause cells indicated below to **span** multiple rows and/or columns.

- Distinguish the **head**, **body**, and **foot** of the table using appropriate elements. (All the rows containing course information are part of the table body. Rows above that are head, rows below are foot.)

 **Use appropriate scope attributes on column and row headers**

Creating a web form

1. At the root of the site (`site`) create `survey.html`.
 1. Much like you did with `glossary.html` copy the contents of `index.html` into file.
 2. Delete all the contents of the `<main>` element.
2. Nest the `div` within `<main>`
3. Add a **level-1 heading** with the content Survey.
4. Add a `form` element

 **Unless otherwise stated the controls from the next steps...**

Each control must be **paired with a label** using an appropriate `for` and `id` attribute
Each `label` **AND** its corresponding control must be **inside a paragraph** element
The labels for **required fields** must contain an **accessible indicator** as discussed in class.

- Control 1: A single-line text field
 - required field
 - Name: `name_field`
 - Label text: What is your name?
- Control 2: An email field
 - Label text: What is your email?
 - Name: `email_field`
 - required field
- Control 3: A number field
 - Label text: Which whole number is best?
 - Name: `best_whole_number`
 - Only integers above 0 are valid
- Control 4: A date field
 - Label text: Which day is best?
 - Name: `best_day`

- Control 5: A dropdown list
 - Label text: Which bear is best?
 - Options:
 - Blank (achieved by setting value to an empty string, and the content of the option to the non-breaking space entity code ` ` ;)
 - Black
 - Brown
 - Care
 - Panda
 - Polar
 - Teddy
 - required field
 - Name: best_bear
- Control 6: A set of radio buttons
 - The whole set is surrounded with a `fieldset` instead of a `paragraph` element
 - Label text (fieldset): Do you like radio buttons?
 - Each label and button pair is a list item in an unordered list
 - Name: enjoys_radio_buttons
 - Options (value):
 - Yes (yes)
 - No (no)
 - None of your business (?) - Default checked option
 - Only one option can be selected at a time
- Control 7: A multi-line text field
 - Label text: What is the meaning of life?
 - Name: life_meaning
 - 5 rows and 50 columns of text as default
 - Placeholder text: Enter the correct answer here
- Control 8: A button
 - No label
 - Text: Send
 - Form is submitted when clicked

If the above is executed correctly you should have a survey page that looks something like:

Survey

What is your name? *

What is your email? *

Which whole number is best?

Which day is best?

Which bear is best? *

✓

Black

Brown

Care

Panda

Polar

Teddy

Do you like radio b

- ☒ Yes
- ☐ No
- ☐ None of your business

Enter the correct answer here

What is the meaning of life?

Send

Connecting your form to a backend

Now let's hook this form up to a proper back end! You can have the form submit to any server endpoint using the action attribute. For this lab, we will use a pre-configured back end from [FormSpree](#).

🔗 This piece does not require a new section to be created.

1. Start by creating an account on FormSpree (using the link above).
2. Once created and verified click the `New Form` button
3. Fill in the popup fields (anything reasonable)
4. Select the `integration` tab after the form has been created.
5. Copy the endpoint URL and set this as the value for the `form` created above in `survey.html`
6. Also update the `form` to have a post method.

 **Try using your form! After every successful submission of the form, you should be able to view the data that was sent to your back end in the 'Submissions' tab for the form you set up in FormSpree.**

OBSERVE: Inspect your form submissions as they are sent by the browser

- Open your browser inspector and click on the 'Network' tab to observe the raw data being sent.
- When your form is submitted, the first request the browser makes (visible in the main panel of the inspector) should be a POST to formspree.io. Select this request.
- After selecting the POST request, you should see a panel at the right with several tabs that display various information about the request. Take a moment to peruse the information in the Header tab. Note the Request URL and Request method, which correspond to the 'action' and 'method' attributes of your form element.
- Now select the 'Params' tab and behold your form data in all its glory! Note that the keys correspond to your form control 'name' attributes, and the values are the values that were entered by the user.
